

React JS Concept Guide

1. What is React?

React is a JavaScript library for building user interfaces. Developed by Facebook.

It uses a component-based architecture and Virtual DOM for fast updates.

2. JSX

JSX is a syntax extension for JavaScript. It lets you write HTML-like code inside JS.

Example: `const element = <h1>Hello, React!</h1>`

3. Components

Components are independent, reusable pieces of UI.

Functional Component Example:

```
function Welcome(props) {  
  return <h1>Hello, {props.name}</h1>;  
}
```

4. State & Props

State: Internal data of a component that can change over time.

Props: Data passed from parent to child component.

5. Hooks

`useState`, `useEffect`, `useContext` are common hooks for managing state and side effects.
